The evolution of the office

Early 20th Century

It's just not that good.

In the early 20th century, coffee was often made in percolators or urns and served in communal pots. This coffee was typically low-quality, over-brewed and stale.

Is the coffee in your office served in communal pots?

Then your workplace is something out of a Dicken's novel.

The evolution of the office

1950s & 1960s

It comes from a vending machine.

In the 50s and 60s, coffee vending machines were popular in offices and factories. These machines dispensed instant coffee, which was convenient but often lacked flavour and quality.

Is your coffee at work from a vending machine?

Do you really want to use your caffeine ration on coffee this bad?

Morgan Lovell

1970s & 1980s

Coffee as a service.

In the 70s and 80s, office coffee services emerged as a popular option for workplace coffee. Providers would bring coffee and brewing equipment to the office, providing a more convenient and enjoyable coffee experience for employees.

Does your office have a press-a-button coffee machine?

It was acceptable in the 80s.

2010s

Office coffee gets real.

In the 2010s, demand for specialty coffee in the workplace grew. Many offices started to offer high quality, single-origin coffee beans and a variety of brewing methods, such as pour-over and French press, to provide employees with a more artisanal coffee experience.

Does your office have hipster barista on staff?

Cool, I'll have an organic, soya, iced frappe, mocha-choca-latte with an extra shot and no foam thank you.

Morgan Lovell

2020s

There's an app for everything.

In the age of the Internet of Things (IoT), many offices are using app-enabled coffee machines that can be controlled through your mobile or integrated with workplace management software. These machines can provide real-time data on coffee consumption, maintenance needs, and brewing parameters, making it easier for employers to manage their workplace coffee programs.

Can you order up a spiced latte from your smartphone in the office?

Looks like your office coffee is 100% up-to-date.

Morgan Lovell

The future

Enter the AI robots.

In the future, offices could be equipped with advanced coffee machines that use AI algorithms to deliver the perfect brew on demand. These machines would be connected to a network of sensors that track employees' caffeine intake, heart rate, and other biometric data to ensure that they are getting the optimal amount of caffeine to keep them alert and focused.

Does your office have a hovering AI robot to brew on-demand, at your desk?

Then you are living in a Netflix sci-fi series.
